

Fitting Instructions #2766IS

Nissan Navara D40

Rear Leaf Spring Front Eye

- Please note that a small pair of location lugs are pressed into the chassis flanges of the front mounts. These are present to aid in the assembly of the vehicles on the factory production line. These lugs protrude into the area where the flanges of the polyurethane bushes fit;
- To allow for ease of fitment and optimal performance of your new polyurethane bushings, we recommend that these lugs be removed, by carefully grinding or filing;
- This modification will allow the leaf spring to be offered up and fitted easily and provide a smooth surface for the polyurethane bushes to shoulder and rotate against;
- Using the grease supplied, lubricate all surfaces of the polyurethane bushings that contact metal.

Two lugs are present above the bolt holes on each inside face of the front mounts.

Carefully remove, by grinding or filing until the surface is flat.
