Original Bush Profile

Original Bush Profile

1. Using a 21mm socket/spanner remove the rear engine support centre bolt that is mounted in the aluminium sub frame.

2. Use the grease supplied to cover the new polyurethane bush and insert the bush into the mount, making sure the voids line up. Once the bush is started a soft face hammer can be used to tap the bush all the way in.

3. With the bush pushed all the way in, insert the 28.5mm washer, the smaller of the two washers supplied, into the hole in the polyurethane bush. Place the remaining captivating washer on the original bolt and refit to the mount. Tighten the bolts to manufacture's specifications or according to the table below:

Bolt Grade	Torque
8.8	40Nm + 90 degrees
10.9	50Nm + 90 degrees

Note: It is recommended to replace the bolts every time they are removed.
